

## STATISTICAL PROFILE ON FEMALE GENITAL MUTILATION/CUTTING

Female genital mutilation/cutting (FGM/C) refers to "all procedures involving partial or total removal of the female external genitalia or other injury to the female genital organs for non-medical reasons." ${ }^{1} \mathrm{FGM} / \mathrm{C}$ is a violation of girls' and women's human rights and is condemned by many international treaties and conventions, as well as by national legislation in many countries. Yet, where it is practised, FGM/C is performed in line with tradition and social norms to ensure that girls are socially accepted and marriageable, and to uphold their status and honour and that of the entire family. UNICEF works with government, civil society partners and other UN agencies towards the elimination of FGM/C in countries where it is still practised.

100

Percentage distribution of girls aged 0 to 14 years who have undergone FGM/C (as reported by their mothers), according to the type of person/practitioner performing the procedure

by the type of FGM/C performed

Notes: The boundaries and the names shown and the designations used on the map do not imply official endorsement or acceptance by are presented. Due to rounding, some of the data presented may not add up to 100 per cent. Prevalence data for girls aged 0 to 14 reflect their current, but not final, FGM/C status since some girls who have not been cut may still be at risk of experiencing the practice once they reach the customary age for cutting. Therefore, the data on prevalence for girls under age 15 is actually an underestimation of the true extent of the practice. Since age at cutting varies among settings, the amoun interpreting all FGM/C prevalence data for this be kept in mind when prevalence of $\mathrm{FGM} / \mathrm{C}$ among daughters of mothers who are unsure about the continuation of the practice are based on 25-49 unweighted cases. Data for girls and women are used to report on age at cutting since the earlier MICS (2005-2006) did not have questions on age at cutting for most recently cut daughters. 'Health personnel' includes doctors, nurses, midwives and other health workers; 'Traditional practitioner' includes traditional circumcisers, traditional birth practitioners. The 2013 DHS did not collect data on the prevalence of FGM/C among girls aged 0 to 14 years. Source for all charts on this page: DHS 2013, unless otherwise noted.

## WHAT ARE THE PREVAILING ATTITUDES TOWARDS FGM/C?

Almost two of three girls and women in Gambia support the continuation of FGM/C

Source: MICS 2010
Percentage of girls and women aged 15 to 49 years who have heard about FGM/C and think the practice should continue, by wealth quintile, education, religion and age

## IS THE PRACTICE OF FGM/C CHANGING?

There has been no significant change in the prevalence of FGM/C in Gambia

Percentage of girls and women aged 15 to 49 years who have undergone FGM/C, by current age

| 100 |  |  |  |  |  |  |  |

Percentage of girls and women aged 15 to 49 years who have undergone FGM/C, and percentage of girls and women aged 15 to 49 years who have heard about FGM/C and think the practice should continue, by survey year

Percentage of girls aged 0 to 14 years who have undergone FGM/C (as reported by their mothers)

Percentage of girls and women aged 15 to 49 years who have heard about FGM/C and think the practice should continue

 (MICS 2010) since the 2013 DHS did not collect these data. MICS data for Ghana (2011) could not be used to report on attitudes towards FGM/C due to the fact that information is missing for girls and women with no living daughters; data from MICS 2006 are used instead. In Liberia, only cut girls and women were asked about their attitudes towards FGM/C; since girls and women from practising
 Prevalence data on FGM/C for girls and women aged 15-49 years and data on attitudes towards FGM/C are not available for Indonesia.
